

Innisfil Beach Road Comprehensive Traffic Evaluation

Client: Town of Innisfil

Year: 2008

SERVICES PROVIDED

A *Comprehensive Traffic Evaluation* was completed of the section of Innisfil Beach Road from 20th Sideroad to Jans Boulevard, in the Town of Innisfil. Continuing development pressures have increased traffic volumes in the area, and while individual studies were completed to support specific developments, there was a need for a comprehensive study to ensure all future demands are appropriately addressed. The purpose of the evaluation was therefore to review traffic studies for various development applications, consider additional development and growth as necessary, and establish comprehensive future traffic projections reflective of all planned and proposed development. The operations of the road system were investigated, including peak hour operations at key intersections, and road system deficiencies and mitigating measures noted. The study identified a road improvement strategy and recommended a corresponding implementation plan to guide the improvements to the area road network. This included road widenings, intersection widenings and upgrades, road extensions and connections, and modifications to development access schemes.
